

SPECIES IDENTIFICATION REQUEST

Date: _____

Customer Name: _____

Job Address: _____

Phone Number: _____

Planet Timbers would like to make the customer aware that any advice given in regards to species identification is our best estimate based on the sample(s)/photo(s) provided, however is not guaranteed to be a correct determination of the timber species. Factors including, but not limited to, timber age, quantity and quality of the samples supplied, natural colour variation, damages of the samples due to water damage/removal/insect attack, natural variations of grains and the coating type used have the potential to make identification difficult. This also includes identification from photographs as tones, focus and the inability to visually inspect the timber can hinder the identification process.

The customer acknowledges that Planet Timbers will not be held responsible if it is deemed that the timber species has been incorrectly identified causing an adverse result to the final product.

If accurate species identification is critical, Planet Timbers recommends you engage a scientific professional to undertake an independent microscopic or DNA lab based analysis. Due to similarities in the cell structure of different timber species, in some instances even lab testing can be prone to errors. For information on how to commission independent species identification, please ask one of our friendly staff.
